# The Human Body App
Explore the systems of the body

The Human Body app is a great app for introducing body systems to students. It is very kid-friendly, and has lots of interactive features. Students can toggle between outside view and inside view of many of the systems. They can turn labels on or off, and select the system(s) they want to view. Double tapping can zoom in on selected parts of a system to show more details. In the digestive system, students can feed their body and follow the path food takes to excretion. They can also interact with the food and organs. Tap anywhere on the nervous system to see the path sensations take through the nerves to the brain. This is a wonderful app for learning about the body.

Classroom Connection

This app is great as an introduction or review of a body systems unit. Have students explore the systems, then create their own models. Students can take a screenshot of a system, import it into an editing app, and label the parts.
